## QUINAZOLINE DERIVATIVES AS ANGIOGENESIS INHIBITORS

INS  
A1

The present invention relates to quinazoline derivatives, processes for their preparation, pharmaceutical compositions containing them as active ingredient, methods for the treatment of disease states associated with angiogenesis and/or increased vascular permeability, to their use as medicaments and to their use in the manufacture of medicaments for use in the production of antiangiogenic and/or vascular permeability reducing effects in warm-blooded animals such as humans.

Normal angiogenesis plays an important role in a variety of processes including embryonic development, wound healing and several components of female reproductive function. Undesirable or pathological angiogenesis has been associated with disease states including diabetic retinopathy, psoriasis, cancer, rheumatoid arthritis, atheroma, Kaposi's sarcoma and haemangioma (Fan et al, 1995, Trends Pharmacol. Sci. 16: 57-66; Folkman, 1995, Nature Medicine 1: 27-31). Alteration of vascular permeability is thought to play a role in both normal and pathological physiological processes (Cullinan-Bove et al, 1993, Endocrinology 133: 829-837; Senger et al, 1993, Cancer and Metastasis Reviews, 12: 303-324). Several polypeptides with in vitro endothelial cell growth promoting activity have been identified including, acidic and basic fibroblast growth factors (aFGF & bFGF) and vascular endothelial growth factor (VEGF). By virtue of the restricted expression of its receptors, the growth factor activity of VEGF, in contrast to that of the FGFs, is relatively specific towards endothelial cells. Recent evidence indicates that VEGF is an important stimulator of both normal and pathological angiogenesis (Jakeman et al, 1993, Endocrinology, 133: 848-859; Kolch et al, 1995, Breast Cancer Research and Treatment, 36:139-155) and vascular permeability (Connolly et al, 1989, J. Biol. Chem. 264: 20017-20024). Antagonism of VEGF action by sequestration of VEGF with antibody can result in inhibition of tumour growth (Kim et al, 1993, Nature 362: 841-844). Basic FGF (bFGF) is a potent stimulator of angiogenesis (e.g. Hayek et al, 1987, Biochem. Biophys. Res. Commun. 147: 876-880) and raised levels of FGFs have been found in the serum (Fujimoto et al, 1991, Biochem. Biophys. Res. Commun. 180: 386-392) and urine (Nguyen et al, 1993, J. Natl. Cancer. Inst. 85: 241-242) of patients with cancer.

Receptor tyrosine kinases (RTKs) are important in the transmission of biochemical signals across the plasma membrane of cells. These transmembrane molecules

characteristically consist of an extracellular ligand-binding domain connected through a segment in the plasma membrane to an intracellular tyrosine kinase domain. Binding of ligand to the receptor results in stimulation of the receptor-associated tyrosine kinase activity which leads to phosphorylation of tyrosine residues on both the receptor and other

5 intracellular molecules. These changes in tyrosine phosphorylation initiate a signalling cascade leading to a variety of cellular responses. To date, at least nineteen distinct RTK subfamilies, defined by amino acid sequence homology, have been identified. One of these subfamilies is presently comprised by the fms-like tyrosine kinase receptor, Flt or Flt1, the kinase insert domain-containing receptor, KDR (also referred to as Flk-1), and another  
10 fms-like tyrosine kinase receptor, Flt4. Two of these related RTKs, Flt and KDR, have been shown to bind VEGF with high affinity (De Vries et al, 1992, Science 255: 989-991; Terman et al, 1992, Biochem. Biophys. Res. Comm. 1992, 187: 1579-1586). Binding of VEGF to these receptors expressed in heterologous cells has been associated with changes in the tyrosine phosphorylation status of cellular proteins and calcium fluxes.

15 The present invention is based on the discovery of compounds that surprisingly inhibit the effects of VEGF, a property of value in the treatment of disease states associated with angiogenesis and/or increased vascular permeability such as cancer, diabetes, psoriasis, rheumatoid arthritis, Kaposi's sarcoma, haemangioma, acute and chronic nephropathies, atheroma, arterial restenosis, autoimmune diseases, acute inflammation, excessive scar  
20 formation and adhesions, endometriosis, dysfunctional uterine bleeding and ocular diseases with retinal vessel proliferation. Compounds of the present invention generally possess higher potency against VEGF receptor tyrosine kinase than against epidermal growth factor (EGF) receptor tyrosine kinase. Compounds of the invention which have been tested possess activity against VEGF receptor tyrosine kinase such that they may be used in an amount  
25 sufficient to inhibit VEGF receptor tyrosine kinase whilst demonstrating no significant activity against EGF receptor tyrosine kinase. Compounds of the present invention generally possess higher potency against VEGF receptor tyrosine kinase than against FGF R1 receptor tyrosine kinase. Compounds of the invention which have been tested possess activity against VEGF receptor tyrosine kinase such that they may be used in an amount sufficient to inhibit  
30 VEGF receptor tyrosine kinase whilst demonstrating no significant activity against FGF R1 receptor tyrosine kinase.

According to one aspect of the present invention there is provided the use of a compound of the formula I:

For the avoidance of doubt it is to be understood that where in this specification a group is qualified by 'hereinbefore defined' or 'defined hereinbefore' the said group encompasses the first occurring and broadest definition as well as each and all of the preferred  
10 definitions for that group.

In this specification unless stated otherwise the term "alkyl" includes both straight and branched chain alkyl groups but references to individual alkyl groups such as "propyl" are specific for the straight chain version only. An analogous convention applies to other generic terms. Unless otherwise stated the term "alkyl" advantageously refers to chains with 1-6  
15 carbon atoms, preferably 1-4 carbon atoms. The term "alkoxy" as used herein, unless stated otherwise includes "alkyl"-O- groups in which "alkyl" is as hereinbefore defined. The term "aryl" as used herein unless stated otherwise includes reference to a C<sub>6-10</sub> aryl group which may, if desired, carry one or more substituents selected from halogeno, alkyl, alkoxy, nitro, trifluoromethyl and cyano, (wherein alkyl and alkoxy are as hereinbefore defined). The term  
20 "aryloxy" as used herein unless otherwise stated includes "aryl"-O-groups in which "aryl" is as hereinbefore defined. The term "sulphonyloxy" as used herein refers to alkylsulphonyloxy and arylsulphonyloxy groups in which "alkyl" and "aryl" are as hereinbefore defined. The term "alkanoyl" as used herein unless otherwise stated includes formyl and alkylC=O groups in which "alkyl" is as defined hereinbefore, for example C<sub>2</sub>alkanoyl is ethanoyl and refers to  
25 CH<sub>3</sub>C=O, C<sub>1</sub>alkanoyl is formyl and refers to CHO. In this specification unless stated otherwise the term "alkenyl" includes both straight and branched chain alkenyl groups but references to individual alkenyl groups such as 2-butenyl are specific for the straight chain version only. Unless otherwise stated the term "alkenyl" advantageously refers to chains with 2-5 carbon atoms, preferably 3-4 carbon atoms. In this specification unless stated otherwise  
30 the term "alkynyl" includes both straight and branched chain alkynyl groups but references to individual alkynyl groups such as 2-butylnyl are specific for the straight chain version only. Unless otherwise stated the term "alkynyl" advantageously refers to chains with 2-5 carbon

atoms, preferably 3-4 carbon atoms. Unless stated otherwise the term "haloalkyl" refers to an alkyl group as defined hereinbefore which bears one or more halogeno groups, such as for example trifluoromethyl.

For the avoidance of any doubt, where  $R^2$  has a value of substituted or unsubstituted  $C_{1-3}$ alkyl,  $R^2$  has been selected from  $C_{1-3}$ alkyl or from a group  $R^5X^1$  wherein  $X^1$  is a direct bond or  $-CH_2-$  and  $R^5$  is  $C_{1-3}$ alkyl which may be unsubstituted or which may be substituted with one or more groups selected from hydroxy, fluoro, chloro, bromo and amino.

Within the present invention it is to be understood that a compound of the formula I or a salt thereof may exhibit the phenomenon of tautomerism and that the formulae drawings within this specification can represent only one of the possible tautomeric forms. It is to be understood that the invention encompasses any tautomeric form which inhibits VEGF receptor tyrosine kinase activity and is not to be limited merely to any one tautomeric form utilised within the formulae drawings. The formulae drawings within this specification can represent only one of the possible tautomeric forms and it is to be understood that the specification encompasses all possible tautomeric forms of the compounds drawn not just those forms which it has been possible to show graphically herein.

It will be appreciated that compounds of the formula I or a salt thereof may possess an asymmetric carbon atom. Such an asymmetric carbon atom is also involved in the tautomerism described above, and it is to be understood that the present invention encompasses any chiral form (including both pure enantiomers, scalemic and racemic mixtures) as well as any tautomeric form which inhibits VEGF receptor tyrosine kinase activity, and is not to be limited merely to any one tautomeric form or chiral form utilised within the formulae drawings. It is to be understood that the invention encompasses all optical and diastereomers which inhibit VEGF receptor tyrosine kinase activity. It is further to be understood that in the names of chiral compounds ( $R,S$ ) denotes any scalemic or racemic mixture while ( $R$ ) and ( $S$ ) denote the enantiomers. In the absence of ( $R,S$ ), ( $R$ ) or ( $S$ ) in the name it is to be understood that the name refers to any scalemic or racemic mixture, wherein a scalemic mixture contains  $R$  and  $S$  enantiomers in any relative proportions and a racemic mixture contains  $R$  and  $S$  enantiomers in the ratio 50:50.

It is also to be understood that certain compounds of the formula I and salts thereof can exist in solvated as well as unsolvated forms such as, for example, hydrated forms. It is to

be understood that the invention encompasses all such solvated forms which inhibit VEGF receptor tyrosine kinase activity.

For the avoidance of any doubt, it is to be understood that when  $X^1$  is, for example, a group of formula  $-NR^6C(O)-$ , it is the nitrogen atom bearing the  $R^6$  group which is attached to the quinazoline ring and the carbonyl ( $C(O)$ ) group is attached to  $R^5$ , whereas when  $X^1$  is, for example, a group of formula  $-C(O)NR^7-$ , it is the carbonyl group which is attached to the quinazoline ring and the nitrogen atom bearing the  $R^7$  group is attached to  $R^5$ . A similar convention applies to the other two atom  $X^1$  linking groups such as  $-NR^9SO_2-$  and  $-SO_2NR^8-$ . When  $X^1$  is  $-NR^{10}-$  it is the nitrogen atom bearing the  $R^{10}$  group which is linked to the quinazoline ring and to  $R^5$ . An analogous convention applies to other groups. It is further to be understood that when  $X^1$  represents  $-NR^{10}-$  and  $R^{10}$  is  $C_{1-3}alkoxyC_{2-3}alkyl$  it is the  $C_{2-3}alkyl$  moiety which is linked to the nitrogen atom of  $X^1$  and an analogous convention applies to other groups.

For the avoidance of any doubt, it is to be understood that in a compound of the formula I when  $R^5$  is, for example, a group of formula  $C_{1-3}alkylX^9C_{1-3}alkylR^{29}$ , it is the terminal  $C_{1-3}alkyl$  moiety which is linked to  $X^1$ , similarly when  $R^5$  is, for example, a group of formula  $C_{2-5}alkenylR^{28}$  it is the  $C_{2-5}alkenyl$  moiety which is linked to  $X^1$  and an analogous convention applies to other groups. When  $R^5$  is a group 1- $R^{29}$ prop-1-en-3-yl it is the first carbon to which the group  $R^{29}$  is attached and it is the third carbon which is linked to  $X^1$  and an analogous convention applies to other groups.

For the avoidance of any doubt, it is to be understood that in a compound of the formula I when  $R^5$  is, for example,  $R^{28}$  and  $R^{28}$  is a pyrrolidinyl ring which bears a group  $-(O-)_f(C_{1-4}alkyl)_gringD$ , it is the  $-O-$  or  $C_{1-4}alkyl$  which is linked to the pyrrolidinyl ring, unless  $f$  and  $g$  are both 0 when it is ring D which is linked to the pyrrolidinyl ring and an analogous convention applies to other groups.

For the avoidance of any doubt, it is to be understood that when  $R^{29}$  carries a  $C_{1-4}aminoalkyl$  substituent it is the  $C_{1-4}alkyl$  moiety which is attached to  $R^{29}$  whereas when  $R^{29}$  carries a  $C_{1-4}alkylamino$  substituent it is the amino moiety which is attached to  $R^{29}$  and an analogous convention applies to other groups.

For the avoidance of any doubt, it is to be understood that when  $R^{28}$  carries a  $C_{1-4}alkoxyC_{1-4}alkyl$  substituent it is the  $C_{1-4}alkyl$  moiety which is attached to  $R^{28}$  and an analogous convention applies to other groups.

The present invention relates to the compounds of formula I as hereinbefore defined as well as to the salts thereof. Salts for use in pharmaceutical compositions will be pharmaceutically acceptable salts, but other salts may be useful in the production of the compounds of formula I and their pharmaceutically acceptable salts. Pharmaceutically acceptable salts of the invention may, for example, include acid addition salts of the compounds of formula I as hereinbefore defined which are sufficiently basic to form such salts. Such acid addition salts include for example salts with inorganic or organic acids affording pharmaceutically acceptable anions such as with hydrogen halides (especially hydrochloric or hydrobromic acid of which hydrochloric acid is particularly preferred) or with sulphuric or phosphoric acid, or with trifluoroacetic, citric or maleic acid. In addition where the compounds of formula I are sufficiently acidic, pharmaceutically acceptable salts may be formed with an inorganic or organic base which affords a pharmaceutically acceptable cation. Such salts with inorganic or organic bases include for example an alkali metal salt, such as a sodium or potassium salt, an alkaline earth metal salt such as a calcium or magnesium salt, an ammonium salt or for example a salt with methylamine, dimethylamine, trimethylamine, piperidine, morpholine or tris-(2-hydroxyethyl)amine.

A compound of the formula I, or salt thereof, and other compounds of the invention (as hereinafter defined) may be prepared by any process known to be applicable to the preparation of chemically-related compounds. Such processes include, for example, those illustrated in European Patent Applications Publication Nos. 0520722, 0566226, 0602851 and 0635498. Such processes also include, for example, solid phase synthesis. Such processes, are provided as a further feature of the invention and are as described hereinafter. Necessary starting materials may be obtained by standard procedures of organic chemistry. The preparation of such starting materials is described within the accompanying non-limiting Examples. Alternatively necessary starting materials are obtainable by analogous procedures to those illustrated which are within the ordinary skill of an organic chemist.

Thus, the following processes (a) to (f) and (i) to (vi) constitute further features of the present invention.

#### Synthesis of Compounds of Formula I

- (a) Compounds of the formula I and salts thereof may be prepared by the reaction of a compound of the formula III:

- 67 -

(III)

(wherein  $R^2$  and  $m$  are as defined hereinbefore and  $L^1$  is a displaceable moiety), with a compound of the formula IV:

(IV)

(wherein ring C,  $R^1$ , Z and  $n$  are as defined hereinbefore) to obtain compounds of the formula I and salts thereof. A convenient displaceable moiety  $L^1$  is, for example, a halogeno, alkoxy (preferably  $C_{1-4}$  alkoxy), aryloxy, alkylsulphanyl, arylsulphanyl, alkoxyalkylsulphanyl or sulphonyloxy group, for example a chloro, bromo, methoxy, phenoxy, methylsulphanyl, 2-methoxyethylsulphanyl, methanesulphonyloxy or toluene-4-sulphonyloxy group.

The reaction is advantageously effected in the presence of a base. Such a base is, for example, an organic amine base such as, for example, pyridine, 2,6-lutidine, collidine, 4-dimethylaminopyridine, triethylamine, morpholine, N-methylmorpholine or diazabicyclo[5.4.0]undec-7-ene, tetramethylguanidine or for example, an alkali metal or alkaline earth metal carbonate or hydroxide, for example sodium carbonate, potassium carbonate, calcium carbonate, sodium hydroxide or potassium hydroxide. Alternatively such a base is, for example, an alkali metal hydride, for example sodium hydride, or an alkali metal or alkaline earth metal amide, for example sodium amide, sodium bis(trimethylsilyl)amide, potassium amide or potassium bis(trimethylsilyl)amide. The reaction is preferably effected in the presence of an inert solvent or diluent, for example an ether such as tetrahydrofuran or 1,4-dioxan, an aromatic hydrocarbon solvent such as toluene, or a dipolar aprotic solvent such

as N,N-dimethylformamide, N,N-dimethylacetamide, N-methylpyrrolidin-2-one or dimethyl sulphoxide. The reaction is conveniently effected at a temperature in the range, for example, 10 to 150°C, preferably in the range 20 to 90°C.

When it is desired to obtain the acid salt, the free base may be treated with an acid such as a hydrogen halide, for example hydrogen chloride, sulphuric acid, a sulphonic acid, for example methane sulphonic acid, or a carboxylic acid, for example acetic or citric acid, using a conventional procedure.

(b) Production of those compounds of formula I and salts thereof wherein at least one  $R^2$  is  $R^5X^1$  wherein  $R^5$  is as defined hereinbefore and  $X^1$  is -O-, -S-, -OC(O)- or -NR<sup>10</sup>-

(wherein  $R^{10}$  independently represents hydrogen, C<sub>1-3</sub>alkyl or C<sub>1-3</sub>alkoxyC<sub>2-3</sub>alkyl) can be achieved by the reaction, conveniently in the presence of a base (as defined hereinbefore in process (a)) of a compound of the formula V:

(V)

(wherein ring C, Z,  $R^1$ ,  $R^2$  and n are as hereinbefore defined and  $X^1$  is as hereinbefore defined in this section and s is an integer from 0 to 2) with a compound of formula VI:

(wherein  $R^5$  and  $L^1$  are as hereinbefore defined),  $L^1$  is a displaceable moiety for example a halogeno or sulphonyloxy group such as a bromo, methanesulphonyloxy or toluene-4-sulphonyloxy group, or  $L^1$  may be generated in situ from an alcohol under standard

Mitsunobu conditions ("Organic Reactions", John Wiley & Sons Inc, 1992, vol 42, chapter 2, David L Hughes). The reaction is preferably effected in the presence of a base (as defined hereinbefore in process (a)) and advantageously in the presence of an inert solvent or diluent

(as defined hereinbefore in process (a)), advantageously at a temperature in the range, for example 10 to 150°C, conveniently at about 50°C.

(c) Compounds of the formula I and salts thereof wherein at least one  $R^2$  is  $R^5X^1$  wherein  $R^5$  is as defined hereinbefore and  $X^1$  is -O-, -S-, -OC(O)- or -NR<sup>10</sup>- (wherein R<sup>10</sup> represents hydrogen, C<sub>1-3</sub>alkyl or C<sub>1-3</sub>alkoxyC<sub>2-3</sub>alkyl) may be prepared by the reaction of a compound of the formula VII:

(VII)

with a compound of the formula VIII:

The reaction may conveniently be effected in the presence of a base (as defined hereinbefore in process (a)) and advantageously in the presence of an inert solvent or diluent (as defined hereinbefore in process (a)), advantageously at a temperature in the range, for example 10 to 150°C, conveniently at about 100°C.

(d) Compounds of the formula I and salts thereof wherein at least one  $R^2$  is  $R^5X^1$  wherein X<sup>1</sup> is as defined hereinbefore and R<sup>5</sup> is C<sub>1-3</sub>alkylR<sup>113</sup>, wherein R<sup>113</sup> is selected from one of the following six groups:

2) NR<sup>116</sup>R<sup>117</sup> (wherein R<sup>116</sup> and R<sup>117</sup> which may be the same or different are each hydrogen, C<sub>1-3</sub>alkyl or C<sub>1-3</sub>alkoxyC<sub>2-3</sub>alkyl);

- 70 -

- 3)  $X^{20}C_{1-3}alkylX^5R^{22}$  (wherein  $X^{20}$  represents -O-, -S-, -SO<sub>2</sub>-, -NR<sup>118</sup>C(O)-, -NR<sup>119</sup>SO<sub>2</sub>- or -NR<sup>120</sup>- (wherein R<sup>118</sup>, R<sup>119</sup>, and R<sup>120</sup> which may be the same or different are each hydrogen, C<sub>1-3</sub>alkyl or C<sub>1-3</sub>alkoxyC<sub>2-3</sub>alkyl) and X<sup>5</sup> and R<sup>22</sup> are as defined hereinbefore);
- 4) R<sup>28</sup> (wherein R<sup>28</sup> is as defined hereinbefore);
- 5)  $X^{21}R^{29}$  (wherein X<sup>21</sup> represents -O-, -S-, -SO<sub>2</sub>-, -NR<sup>121</sup>C(O)-, -NR<sup>122</sup>SO<sub>2</sub>-, or -NR<sup>123</sup>- (wherein R<sup>121</sup>, R<sup>122</sup>, and R<sup>123</sup> which may be the same or different are each hydrogen, C<sub>1-3</sub>alkyl or C<sub>1-3</sub>alkoxyC<sub>2-3</sub>alkyl) and R<sup>29</sup> is as defined hereinbefore); and
- 6)  $X^{22}C_{1-3}alkylR^{29}$  (wherein X<sup>22</sup> represents -O-, -S-, -SO<sub>2</sub>-, -NR<sup>124</sup>C(O)-, -NR<sup>125</sup>SO<sub>2</sub>- or -NR<sup>126</sup>- (wherein R<sup>124</sup>, R<sup>125</sup> and R<sup>126</sup> each independently represents hydrogen, C<sub>1-3</sub>alkyl or C<sub>1-3</sub>alkoxyC<sub>2-3</sub>alkyl) and R<sup>29</sup> is as defined hereinbefore);
- and additionally R<sup>113</sup> may be selected from the following three groups:
- 7) R<sup>29</sup> (wherein R<sup>29</sup> is as defined hereinbefore);

in process (a)) and advantageously in the presence of an inert solvent or diluent (as defined hereinbefore in process (a)), and at a temperature in the range, for example 0 to 150°C, conveniently at about 50°C.

Processes (a) and (b) are preferred over processes (c) and (d).

5 Process (a) is preferred over processes (b), (c) and (d).

(e) The production of those compounds of the formula I and salts thereof wherein one or more of the substituents  $(R^2)_m$  is represented by  $-NR^{127}R^{128}$ , where one (and the other is hydrogen) or both of  $R^{127}$  and  $R^{128}$  are  $C_{1-3}$ alkyl, may be effected by the reaction of compounds of formula I wherein the substituent  $(R^2)_m$  is an amino group and an alkylating agent, preferably in the presence of a base as defined hereinbefore. Such alkylating agents are  $C_{1-3}$ alkyl moieties bearing a displaceable moiety as defined hereinbefore such as  $C_{1-3}$ alkyl halides for example  $C_{1-3}$ alkyl chloride, bromide or iodide. The reaction is preferably effected in the presence of an inert solvent or diluent (as defined hereinbefore in process (a)) and at a temperature in the range, for example, 10 to 100°C, conveniently at about ambient temperature. The production of compounds of formula I and salts thereof wherein one or more of the substituents  $R^2$  is an amino group may be effected by the reduction of a corresponding compound of formula I wherein the substituent(s) at the corresponding position(s) of the quinazoline group is/are a nitro group(s). The reduction may conveniently be effected as described in process (i) hereinafter. The production of a compound of formula I and salts thereof wherein the substituent(s) at the corresponding position(s) of the quinazoline group is/are a nitro group(s) may be effected by the processes described hereinbefore and hereinafter in processes (a-d) and (i-v) using a compound selected from the compounds of the formulae (I-XXII) in which the substituent(s) at the corresponding position(s) of the quinazoline group is/are a nitro group(s).

25 (f) Compounds of the formula I and salts thereof wherein  $X^1$  is  $-SO-$  or  $-SO_2-$  may be prepared by oxidation from the corresponding compound in which  $X^1$  is  $-S-$  or  $-SO-$  (when  $X^1$  is  $-SO_2-$  is required in the final product). Conventional oxidation conditions and reagents for such reactions are well known to the skilled chemist.

#### Synthesis of Intermediates

30 (i) The compounds of formula III and salts thereof in which  $L^1$  is halogeno may for example be prepared by halogenating a compound of the formula XI:

- 72 -

(XI)

wherein  $R^2$  and  $m$  are as hereinbefore defined).

Convenient halogenating agents include inorganic acid halides, for example thionyl chloride, phosphorus(III)chloride, phosphorus(V)oxychloride and phosphorus(V)chloride.

- 10 The halogenation reaction may be effected in the presence of an inert solvent or diluent such as for example a halogenated solvent such as methylene chloride, trichloromethane or carbon tetrachloride, or an aromatic hydrocarbon solvent such as benzene or toluene, or the reaction may be effected without the presence of a solvent. The reaction is conveniently effected at a temperature in the range, for example 10 to 150°C, preferably in the range 40 to 100°C.

- 15 The compounds of formula XI and salts thereof may, for example, be prepared by reacting a compound of the formula XII:

(XII)

- 25 (wherein  $R^2$ ,  $s$  and  $L^1$  are as hereinbefore defined) with a compound of the formula VIII as hereinbefore defined. The reaction may conveniently be effected in the presence of a base (as defined hereinbefore in process (a)) and advantageously in the presence of an inert solvent or diluent (as defined hereinbefore in process (a)), advantageously at a temperature in the range, for example 10 to 150°C, conveniently at about 100°C.

- 30 Compounds of formula XI and salts thereof wherein at least one  $R^2$  is  $R^5X^1$  and wherein  $X^1$  is -O-, -S-, -SO-, -SO<sub>2</sub>-, -C(O)-, -C(O)NR<sup>7</sup>-, -SO<sub>2</sub>NR<sup>8</sup>- or -NR<sup>10</sup>- (wherein  $R^7$ ,  $R^8$

- 73 -

and R<sup>10</sup> each independently represents hydrogen, C<sub>1-3</sub>alkyl or C<sub>1-3</sub>alkoxyC<sub>2-3</sub>alkyl), may for example also be prepared by the reaction of a compound of the formula XIII:

(XIII)

(wherein R<sup>2</sup> and s are as hereinbefore defined and X<sup>1</sup> is as hereinbefore defined in this section) with a compound of the formula VI as hereinbefore defined. The reaction may for example be effected as described for process (b) hereinbefore. The pivaloyloxymethyl group can then be cleaved by reacting the product with a base such as, for example, aqueous ammonia, triethylamine in water, an alkali metal or alkaline earth metal hydroxide or alkoxide, preferably aqueous ammonia, aqueous sodium hydroxide or aqueous potassium hydroxide, in a polar protic solvent such as an alcohol, for example methanol or ethanol. The reaction is conveniently effected at a temperature in the range 20 to 100°C, preferably in the range 20 to 50°C.

The compounds of formula XI and salts thereof may also be prepared by cyclising a compound of the formula XIV:

(XIV)

(wherein R<sup>2</sup> and m, are as hereinbefore defined, and A<sup>1</sup> is an hydroxy, alkoxy (preferably C<sub>1-3</sub>alkoxy) or amino group) whereby to form a compound of formula XI or salt thereof. The cyclisation may be effected by reacting a compound of the formula XIV, where A<sup>1</sup> is an hydroxy or alkoxy group, with formamide or an equivalent thereof effective to cause cyclisation whereby a compound of formula XI or salt thereof is obtained, such as [3-

(dimethylamino)-2-azaprop-2-enylidene]dimethylammonium chloride. The cyclisation is conveniently effected in the presence of formamide as solvent or in the presence of an inert solvent or diluent such as an ether for example 1,4-dioxan. The cyclisation is conveniently effected at an elevated temperature, preferably in the range 80 to 200°C. The compounds of formula XI may also be prepared by cyclising a compound of the formula XIV, where A<sup>1</sup> is an amino group, with formic acid or an equivalent thereof effective to cause cyclisation whereby a compound of formula XI or salt thereof is obtained. Equivalents of formic acid effective to cause cyclisation include for example a tri-C<sub>1-4</sub>alkoxymethane, for example triethoxymethane and trimethoxymethane. The cyclisation is conveniently effected in the presence of a catalytic amount of an anhydrous acid, such as a sulphonic acid for example p-toluenesulphonic acid, and in the presence of an inert solvent or diluent such as for example a halogenated solvent such as methylene chloride, trichloromethane or carbon tetrachloride, an ether such as diethyl ether or tetrahydrofuran, or an aromatic hydrocarbon solvent such as toluene. The cyclisation is conveniently effected at a temperature in the range, for example 10 to 100°C, preferably in the range 20 to 50°C.

Compounds of formula XIV and salts thereof may for example be prepared by the reduction of the nitro group in a compound of the formula XV:

(XV)

(wherein  $R^2$ ,  $m$  and  $A^1$  are as hereinbefore defined) to yield a compound of formula XIV as hereinbefore defined. The reduction of the nitro group may conveniently be effected by any of the procedures known for such a transformation. The reduction may be carried out, for example, by stirring a solution of the nitro compound under hydrogen at 1 to 4 atmospheres pressure in the presence of an inert solvent or diluent as defined hereinbefore in the presence of a metal effective to catalyse hydrogenation reactions such as palladium or platinum. A

- 75 -

further reducing agent is, for example, an activated metal such as activated iron (produced for example by washing iron powder with a dilute solution of an acid such as hydrochloric acid). Thus, for example, the reduction may be effected by heating the nitro compound under hydrogen at 2 atmospheres pressure in the presence of the activated metal and a solvent or diluent such as a mixture of water and alcohol, for example methanol or ethanol, at a temperature in the range, for example 50 to 150°C, conveniently at about 70°C.

Compounds of the formula XV and salts thereof may for example be prepared by the reaction of a compound of the formula XVI:

(XVI)

(wherein  $\text{R}^2$ ,  $s$ ,  $\text{L}^1$  and  $\text{A}^1$  are as hereinbefore defined) with a compound of the formula VIII as hereinbefore defined to give a compound of the formula XV. The reaction of the compounds of formulae XVI and VIII is conveniently effected under conditions as described for process (c) hereinbefore.

Compounds of formula XV and salts thereof wherein at least one  $\text{R}^2$  is  $\text{R}^5\text{X}^1$  and wherein  $\text{X}^1$  is  $-\text{O}-$ ,  $-\text{S}-$ ,  $-\text{SO}_2-$ ,  $-\text{C}(\text{O})-$ ,  $-\text{C}(\text{O})\text{NR}^7-$ ,  $-\text{SO}_2\text{NR}^8-$  or  $-\text{NR}^{10}-$  (wherein  $\text{R}^7$ ,  $\text{R}^8$  and  $\text{R}^{10}$  each independently represents hydrogen,  $\text{C}_{1-3}$ alkyl or  $\text{C}_{1-3}$ alkoxy $\text{C}_{2-3}$ alkyl), may for example also be prepared by the reaction of a compound of the formula XVII:

(XVII)

(wherein  $R^2$ ,  $s$  and  $A^1$  are as hereinbefore defined and  $X^1$  is as hereinbefore defined in this section) with a compound of the formula VI as hereinbefore defined to yield a compound of formula XV as hereinbefore defined. The reaction of the compounds of formulae XVII and VI is conveniently effected under conditions as described for process (b) hereinbefore.

5 The compounds of formula III and salts thereof wherein at least one  $R^2$  is  $R^5X^1$  and wherein  $X^1$  is  $-CH_2-$  may be prepared for example as described above from a compound of the formula XV (in which  $R^2$  is  $-CH_3$ ) or XIII (in which  $HX^1-$  is  $-CH_3$ ), by radical bromination or chlorination to give a  $-CH_2Br$  or  $-CH_2Cl$  group which may then be reacted with a compound of the formula  $R^5-H$  under standard conditions for such substitution reactions.

10 The compounds of formula III and salts thereof wherein at least one  $R^2$  is  $R^5X^1$  and wherein  $X^1$  is a direct bond may be prepared for example as described above from a compound of the formula XI, wherein the  $R^5$  group is already present in the intermediate compounds (for example in a compound of the formula XV) used to prepare the compound of formula XI.

15 The compounds of formula III and salts thereof wherein at least one  $R^2$  is  $R^5X^1$  and wherein  $X^1$  is  $-NR^6C(O)-$  or  $-NR^9SO_2-$  may be prepared for example from a compound of the formula XIII in which  $HX^1-$  is an  $-NHR^6-$  or  $-NHR^9-$  group (prepared for example from an amino group (later functionalised if necessary) by reduction of a nitro group) which is reacted with an acid chloride or sulfonyl chloride compound of the formula  $R^5COCl$  or  $R^5SO_2Cl$ .

20 The compounds of formula III and salts thereof wherein at least one  $R^2$  is  $R^5X^1$  and wherein  $X^1$  is  $-O-$ ,  $-S-$ ,  $-SO_2-$ ,  $-OC(O)-$ ,  $-C(O)NR^7-$ ,  $-SO_2NR^8-$  or  $-NR^{10}-$  (wherein  $R^7$ ,  $R^8$  and  $R^{10}$  each independently represents hydrogen,  $C_{1-3}$ alkyl or  $C_{1-3}$ alkoxy $C_{2-3}$ alkyl), may also be prepared for example by reacting a compound of the formula XVIII:

(XVIII)

30

(wherein  $R^2$  and  $s$  are as hereinbefore defined,  $X^1$  is as hereinbefore defined in this section and  $L^2$  represents a displaceable protecting moiety) with a compound of the formula VI as hereinbefore defined, whereby to obtain a compound of formula III in which  $L^1$  is represented by  $L^2$ .

5 A compound of formula XVIII is conveniently used in which  $L^2$  represents a phenoxy group which may if desired carry up to 5 substituents, preferably up to 2 substituents, selected from halogeno, nitro and cyano. The reaction may be conveniently effected under conditions as described for process (b) hereinbefore.

10 The compounds of formula XVIII and salts thereof may for example be prepared by deprotecting a compound of the formula XIX:

(XIX)

15 (wherein  $R^2$ ,  $s$  and  $L^2$  are as hereinbefore defined,  $P^1$  is a protecting group and  $X^1$  is as hereinbefore defined in the section describing compounds of the formula XVIII). The choice of protecting group  $P^1$  is within the standard knowledge of an organic chemist, for example those included in standard texts such as "Protective Groups in Organic Synthesis" T.W. Greene and R.G.M. Wuts, 2nd Ed. Wiley 1991, including N-sulphonyl derivatives (for  
20 example, p-toluenesulphonyl), carbamates (for example, t-butyl carbonyl), N-alkyl derivatives (for example, 2-chloroethyl, benzyl) and amino acetal derivatives (for example benzyloxymethyl). The removal of such a protecting group may be effected by any of the procedures known for such a transformation, including those reaction conditions indicated in  
25 standard texts such as that indicated hereinbefore, or by a related procedure. Deprotection may be effected by techniques well known in the literature, for example where  $P^1$  represents a benzyl group deprotection may be effected by hydrogenolysis or by treatment with trifluoroacetic acid.

One compound of formula III may if desired be converted into another compound of formula III in which the moiety  $L^1$  is different. Thus for example a compound of formula III in which  $L^1$  is other than halogeno, for example optionally substituted phenoxy, may be converted to a compound of formula III in which  $L^1$  is halogeno by hydrolysis of a compound of formula III (in which  $L^1$  is other than halogeno) to yield a compound of formula XI as hereinbefore defined, followed by introduction of halide to the compound of formula XI, thus obtained as hereinbefore defined, to yield a compound of formula III in which  $L^1$  represents halogen.

(ii) Compounds of formula IV and salts thereof in which ring C is an indolyl may be prepared by any of the methods known in the art, such as for example those described in "Indoles Part I", "Indoles Part II", 1972 John Wiley & Sons Ltd and "Indoles Part III" 1979, John Wiley & Sons Ltd, edited by W. J. Houlihan.

Examples of the preparation of indoles are given in the Examples hereinafter, such as Examples 48, 237, 242, 250 and 291.

Compounds of formula IV and salts thereof in which ring C is a quinolinyll may be prepared by any of the methods known in the art, such as for example those described in "The Chemistry of Heterocyclic Compounds: Quinolines Parts I, II and III", 1982 (Interscience publications) John Wiley & Sons Ltd, edited by G. Jones, and in "Comprehensive Heterocyclic Chemistry Vol II by A. R. Katritzky", 1984 Pergamon Press, edited by A. J. Boulton and A McKillop.

(iii) Compounds of formula V as hereinbefore defined and salts thereof may be made by deprotecting the compound of formula XX:

(XX)

(wherein ring C, Z, R<sup>1</sup>, R<sup>2</sup>, P<sup>1</sup>, n and s are as hereinbefore defined and X<sup>1</sup> is as hereinbefore defined in the section describing compounds of the formula V) by a process for example as described in (i) above.

Compounds of the formula XX and salts thereof may be made by reacting compounds of the formulae XIX and IV as hereinbefore defined, under the conditions described in (a) hereinbefore, to give a compound of the formula XX or salt thereof.

(iv) Compounds of the formula VII and salts thereof may be made by reacting a compound of the formula XXI:

(XXI)

(wherein R<sup>2</sup>, s and each L<sup>1</sup> are as hereinbefore defined and the L<sup>1</sup> in the 4-position and the other L<sup>1</sup> in a further position on the quinazoline ring may be the same or different) with a compound of the formula IV as hereinbefore defined, the reaction for example being effected by a process as described in (a) above.

(v) Compounds of formula IX as defined hereinbefore and salts thereof may for example be made by the reaction of compounds of formula V as defined hereinbefore with compounds of the formula XXII:

(wherein L<sup>1</sup> is as hereinbefore defined) to give compounds of formula IX or salts thereof. The reaction may be effected for example by a process as described in (b) above.

(vi) Intermediate compounds wherein X<sup>1</sup> is -SO- or -SO<sub>2</sub>- may be prepared by oxidation from the corresponding compound in which X<sup>1</sup> is -S- or -SO- (when X<sup>1</sup> is -SO<sub>2</sub>- is required in the final product). Conventional oxidation conditions and reagents for such reactions are well known to the skilled chemist.

When a pharmaceutically acceptable salt of a compound of the formula I is required, it may be obtained, for example, by reaction of said compound with, for example, an acid using a conventional procedure, the acid having a pharmaceutically acceptable anion.

Many of the intermediates defined herein, for example, those of the formulae V, VII, IX and XX are novel and these are provided as a further feature of the invention. The preparation of these compounds is as described herein and/or is by methods well known to persons skilled in the art of organic chemistry.

The identification of compounds which potently inhibit the tyrosine kinase activity associated with VEGF receptors such as Flt and/or KDR and which inhibit angiogenesis and/or increased vascular permeability is desirable and is the subject of the present invention. These properties may be assessed, for example, using one or more of the procedures set out below:

(a) In Vitro Receptor Tyrosine Kinase Inhibition Test

This assay determines the ability of a test compound to inhibit tyrosine kinase activity. DNA encoding VEGF, FGF or EGF receptor cytoplasmic domains may be obtained by total gene synthesis (Edwards M, International Biotechnology Lab 5(3), 19-25, 1987) or by cloning. These may then be expressed in a suitable expression system to obtain polypeptide with tyrosine kinase activity. For example VEGF, FGF and EGF receptor cytoplasmic domains, which were obtained by expression of recombinant protein in insect cells, were found to display intrinsic tyrosine kinase activity. In the case of the VEGF receptor Flt (Genbank accession number X51602), a 1.7kb DNA fragment encoding most of the cytoplasmic domain, commencing with methionine 783 and including the termination codon, described by Shibuya et al (Oncogene, 1990, 5: 519-524), was isolated from cDNA and cloned into a baculovirus transplacement vector (for example pAcYM1 (see The Baculovirus Expression System: A Laboratory Guide, L.A. King and R. D. Possee; Chapman and Hall, 1992) or pAc360 or pBlueBacHis (available from Invitrogen Corporation)). This recombinant construct was co-transfected into insect cells (for example Spodoptera frugiperda 21(Sf21)) with viral DNA (eg Pharmingen BaculoGold) to prepare recombinant baculovirus. (Details of the methods for the assembly of recombinant DNA molecules and the preparation and use of recombinant baculovirus can be found in standard texts for example Sambrook et al, 1989, Molecular cloning - A Laboratory Manual, 2nd edition, Cold Spring Harbour Laboratory Press and O'Reilly et al, 1992, Baculovirus Expression Vectors - A Laboratory Manual, W. H.

Freeman and Co, New York). For other tyrosine kinases for use in assays, cytoplasmic fragments starting from methionine 806 (KDR, Genbank accession number L04947), methionine 668 (EGF receptor, Genbank accession number X00588) and methionine 399 (FGF R1 receptor, Genbank accession number X51803) may be cloned and expressed in a similar manner.

For expression of cFIt tyrosine kinase activity, Sf21 cells were infected with plaque-pure cFIt recombinant virus at a multiplicity of infection of 3 and harvested 48 hours later. Harvested cells were washed with ice cold phosphate buffered saline solution (PBS) (10mM sodium phosphate pH7.4, 138mM sodium chloride, 2.7mM potassium chloride) then resuspended in ice cold HNTG/PMSF (20mM Hepes pH7.5, 150mM sodium chloride, 10% v/v glycerol, 1% v/v Triton X100, 1.5mM magnesium chloride, 1mM ethylene glycol-bis( $\beta$ aminoethyl ether) N,N,N',N'-tetraacetic acid (EGTA), 1mM PMSF (phenylmethylsulphonyl fluoride); the PMSF is added just before use from a freshly-prepared 100mM solution in methanol) using 1ml HNTG/PMSF per 10 million cells. The suspension was centrifuged for 10 minutes at 13,000 rpm at 4°C, the supernatant (enzyme stock) was removed and stored in aliquots at -70°C. Each new batch of stock enzyme was titrated in the assay by dilution with enzyme diluent (100mM Hepes pH 7.4, 0.2mM sodium orthovanadate, 0.1% v/v Triton X100, 0.2mM dithiothreitol). For a typical batch, stock enzyme is diluted 1 in 2000 with enzyme diluent and 50 $\mu$ l of dilute enzyme is used for each assay well.

A stock of substrate solution was prepared from a random copolymer containing tyrosine, for example Poly (Glu, Ala, Tyr) 6:3:1 (Sigma P3899), stored as 1 mg/ml stock in PBS at -20°C and diluted 1 in 500 with PBS for plate coating.

On the day before the assay 100 $\mu$ l of diluted substrate solution was dispensed into all wells of assay plates (Nunc maxisorp 96-well immunoplates) which were sealed and left overnight at 4°C.

On the day of the assay the substrate solution was discarded and the assay plate wells were washed once with PBST (PBS containing 0.05% v/v Tween 20) and once with 50mM Hepes pH7.4.

Test compounds were diluted with 10% dimethylsulphoxide (DMSO) and 25 $\mu$ l of diluted compound was transferred to wells in the washed assay plates. "Total" control wells contained 10% DMSO instead of compound. Twenty five microlitres of 40mM manganese(II)chloride containing 8 $\mu$ M adenosine-5'-triphosphate (ATP) was added to all test

wells except "blank" control wells which contained manganese(II)chloride without ATP. To start the reactions 50µl of freshly diluted enzyme was added to each well and the plates were incubated at room temperature for 20 minutes. The liquid was then discarded and the wells were washed twice with PBST. One hundred microlitres of mouse IgG anti-phosphotyrosine antibody (Upstate Biotechnology Inc. product 05-321), diluted 1 in 6000 with PBST containing 0.5% w/v bovine serum albumin (BSA), was added to each well and the plates were incubated for 1 hour at room temperature before discarding the liquid and washing the wells twice with PBST. One hundred microlitres of horse radish peroxidase (HRP)-linked sheep anti-mouse Ig antibody (Amersham product NXA 931), diluted 1 in 500 with PBST containing 0.5% w/v BSA, was added and the plates were incubated for 1 hour at room temperature before discarding the liquid and washing the wells twice with PBST. One hundred microlitres of 2,2'-azino-bis(3-ethylbenzthiazoline-6-sulphonic acid) (ABTS) solution, freshly prepared using one 50mg ABTS tablet (Boehringer 1204 521) in 50ml freshly prepared 50mM phosphate-citrate buffer pH5.0 + 0.03% sodium perborate (made with 1 phosphate citrate buffer with sodium perborate (PCSB) capsule (Sigma P4922) per 100ml distilled water), was added to each well. Plates were then incubated for 20-60 minutes at room temperature until the optical density value of the "total" control wells, measured at 405nm using a plate reading spectrophotometer, was approximately 1.0. "Blank" (no ATP) and "total" (no compound) control values were used to determine the dilution range of test compound which gave 50% inhibition of enzyme activity.

#### (b) In Vitro HUVEC Proliferation Assay

This assay determines the ability of a test compound to inhibit the growth factor-stimulated proliferation of human umbilical vein endothelial cells (HUVEC).

HUVEC cells were isolated in MCDB 131 (Gibco BRL) + 7.5% v/v foetal calf serum (FCS) and were plated out (at passage 2 to 8), in MCDB 131 + 2% v/v FCS + 3µg/ml heparin + 1µg/ml hydrocortisone, at a concentration of 1000 cells/well in 96 well plates. After a minimum of 4 hours they were dosed with the appropriate growth factor (i.e. VEGF 3ng/ml, EGF 3ng/ml or b-FGF 0.3ng/ml) and compound. The cultures were then incubated for 4 days at 37°C with 7.5% CO<sub>2</sub>. On day 4 the cultures were pulsed with 1µCi/well of tritiated-thymidine (Amersham product TRA 61) and incubated for 4 hours. The cells were harvested using a 96-well plate harvester (Tomtek) and then assayed for incorporation of

tritium with a Beta plate counter. Incorporation of radioactivity into cells, expressed as cpm, was used to measure inhibition of growth factor-stimulated cell proliferation by compounds.

(c) In Vivo Solid Tumour Disease Model

5           This test measures the capacity of compounds to inhibit solid tumour growth.

CaLu-6 tumour xenografts were established in the flank of female athymic Swiss *nu/nu* mice, by subcutaneous injection of  $1 \times 10^6$  CaLu-6 cells/mouse in 100 $\mu$ l of a 50% (v/v) solution of Matrigel in serum free culture medium. Ten days after cellular implant, mice were allocated to groups of 8-10, so as to achieve comparable group mean volumes. Tumours were  
10   measured using vernier calipers and volumes were calculated as:  $(l \times w) \times \sqrt{(l \times w) \times (\pi/6)}$ , where  $l$  is the longest diameter and  $w$  the diameter perpendicular to the longest. Test compounds were administered orally once daily for a minimum of 21 days, and control animals received compound diluent. Tumours were measured twice weekly. The level of growth inhibition was calculated by comparison of the mean tumour volume of the control  
15   group versus the treatment group using a Student T test and/or a Mann-Whitney Rank Sum Test. The inhibitory effect of compound treatment was considered significant when  $p < 0.05$ .

According to a further aspect of the invention there is provided a pharmaceutical composition which comprises a compound of the formula I as defined hereinbefore or a pharmaceutically acceptable salt thereof, in association with a pharmaceutically acceptable  
20   excipient or carrier.

The composition may be in a form suitable for oral administration, for example as a tablet or capsule, for parenteral injection (including intravenous, subcutaneous, intramuscular, intravascular or infusion) for example as a sterile solution, suspension or emulsion, for topical administration for example as an ointment or cream or for rectal administration for example as  
25   a suppository. In general the above compositions may be prepared in a conventional manner using conventional excipients.

The compositions of the present invention are advantageously presented in unit dosage form. The compound will normally be administered to a warm-blooded animal at a unit dose within the range 5-5000mg per square metre body area of the animal, i.e.  
30   approximately 0.1-100mg/kg. A unit dose in the range, for example, 1-100mg/kg, preferably 1-50mg/kg is envisaged and this normally provides a therapeutically-effective dose. A unit

dose form such as a tablet or capsule will usually contain, for example 1-250mg of active ingredient.

According to a further aspect of the present invention there is provided a compound of the formula I or a pharmaceutically acceptable salt thereof as defined hereinbefore for use in a method of treatment of the human or animal body by therapy.

We have found that compounds of the present invention inhibit VEGF receptor tyrosine kinase activity and are therefore of interest for their antiangiogenic effects and/or their ability to cause a reduction in vascular permeability.

A further feature of the present invention is a compound of formula I, or a pharmaceutically acceptable salt thereof, for use as a medicament, conveniently a compound of formula I, or a pharmaceutically acceptable salt thereof, for use as a medicament for producing an antiangiogenic and/or vascular permeability reducing effect in a warm-blooded animal such as a human being.

Thus according to a further aspect of the invention there is provided the use of a compound of the formula I, or a pharmaceutically acceptable salt thereof in the manufacture of a medicament for use in the production of an antiangiogenic and/or vascular permeability reducing effect in a warm-blooded animal such as a human being.

According to a further feature of the invention there is provided a method for producing an antiangiogenic and/or vascular permeability reducing effect in a warm-blooded animal, such as a human being, in need of such treatment which comprises administering to said animal an effective amount of a compound of formula I or a pharmaceutically acceptable salt thereof as defined hereinbefore.

As stated above the size of the dose required for the therapeutic or prophylactic treatment of a particular disease state will necessarily be varied depending on the host treated, the route of administration and the severity of the illness being treated. Preferably a daily dose in the range of 1-50mg/kg is employed. However the daily dose will necessarily be varied depending upon the host treated, the particular route of administration, and the severity of the illness being treated. Accordingly the optimum dosage may be determined by the practitioner who is treating any particular patient.

The antiangiogenic and/or vascular permeability reducing treatment defined hereinbefore may be applied as a sole therapy or may involve, in addition to a compound of the invention, one or more other substances and/or treatments. Such conjoint treatment may

be achieved by way of the simultaneous, sequential or separate administration of the individual components of the treatment. In the field of medical oncology it is normal practice to use a combination of different forms of treatment to treat each patient with cancer. In medical oncology the other component(s) of such conjoint treatment in addition to the  
5 antiangiogenic and/or vascular permeability reducing treatment defined hereinbefore may be: surgery, radiotherapy or chemotherapy. Such chemotherapy may cover three main categories of therapeutic agent:

(i) other antiangiogenic agents that work by different mechanisms from those defined hereinbefore (for example linomide, inhibitors of integrin  $\alpha v \beta 3$  function, angiostatin, razoxin,  
10 thalidomide), and including vascular targeting agents (for example combretastatin phosphate and the vascular damaging agents described in International Patent Application Publication No. WO 99/02166 the entire disclosure of which document is incorporated herein by reference, (for example N-acetylcolchicol-O-phosphate));

(ii) cytostatic agents such as antioestrogens (for example tamoxifen, toremifene, raloxifene,  
15 droloxifene, idoxifene), progestogens (for example megestrol acetate), aromatase inhibitors (for example anastrozole, letrozole, vorazole, exemestane), antiprogestogens, antiandrogens (for example flutamide, nilutamide, bicalutamide, cyproterone acetate), LHRH agonists and antagonists (for example goserelin acetate, luprolide), inhibitors of testosterone 5 $\alpha$ -dihydroreductase (for example finasteride), anti-invasion agents (for example  
20 metalloproteinase inhibitors like marimastat and inhibitors of urokinase plasminogen activator receptor function) and inhibitors of growth factor function, (such growth factors include for example platelet derived growth factor and hepatocyte growth factor such inhibitors include growth factor antibodies, growth factor receptor antibodies, tyrosine kinase inhibitors and serine/threonine kinase inhibitors); and

(iii) antiproliferative/antineoplastic drugs and combinations thereof, as used in medical oncology, such as antimetabolites (for example antifolates like methotrexate, fluoropyrimidines like 5-fluorouracil, purine and adenosine analogues, cytosine arabinoside);  
25 antitumour antibiotics (for example anthracyclines like doxorubicin, daunomycin, epirubicin and idarubicin, mitomycin-C, dactinomycin, mithramycin); platinum derivatives (for example  
30 cisplatin, carboplatin); alkylating agents (for example nitrogen mustard, melphalan, chlorambucil, busulphan, cyclophosphamide, ifosfamide, nitrosoureas, thiotepa); antimitotic agents (for example vinca alkaloids like vincristine and taxoids like taxol, taxotere);

topoisomerase inhibitors (for example epipodophyllotoxins like etoposide and teniposide, amsacrine, topotecan, and also irinotecan); also enzymes (for example asparaginase); and thymidylate synthase inhibitors (for example raltitrexed); and additional types of chemotherapeutic agent include:

- 5 (iv) biological response modifiers (for example interferon); and  
(v) antibodies (for example edrecolomab).

For example such conjoint treatment may be achieved by way of the simultaneous, sequential or separate administration of a compound of formula I as defined hereinbefore, and a vascular targeting agent described in WO 99/02166 such as N-acetylcolchicol-O-phosphate  
10 (Exampe 1 of WO 99/02166).

As stated above the compounds defined in the present invention are of interest for their antiangiogenic and/or vascular permeability reducing effects. Such compounds of the invention are expected to be useful in a wide range of disease states including cancer, diabetes, psoriasis, rheumatoid arthritis, Kaposi's sarcoma, haemangioma, acute and chronic  
15 nephropathies, atheroma, arterial restenosis, autoimmune diseases, acute inflammation, excessive scar formation and adhesions, endometriosis, dysfunctional uterine bleeding and ocular diseases with retinal vessel proliferation. In particular such compounds of the invention are expected to slow advantageously the growth of primary and recurrent solid tumours of, for example, the colon, breast, prostate, lungs and skin. More particularly such  
20 compounds of the invention are expected to inhibit the growth of those primary and recurrent solid tumours which are associated with VEGF, especially those tumours which are significantly dependent on VEGF for their growth and spread, including for example, certain tumours of the colon, breast, prostate, lung, vulva and skin.

In addition to their use in therapeutic medicine, the compounds of formula I and  
25 their pharmaceutically acceptable salts are also useful as pharmacological tools in the development and standardisation of in vitro and in vivo test systems for the evaluation of the effects of inhibitors of VEGF receptor tyrosine kinase activity in laboratory animals such as cats, dogs, rabbits, monkeys, rats and mice, as part of the search for new therapeutic agents.

It is to be understood that where the term "ether" is used anywhere in this  
30 specification it refers to diethyl ether.

(i) evaporations were carried out by rotary evaporation in vacuo and work-up procedures were carried out after removal of residual solids such as drying agents by  
5 filtration;

(ii) operations were carried out at ambient temperature, that is in the range 18-25°C and under an atmosphere of an inert gas such as argon;

10 Lichroprep RP-18 (Art. 9303) reversed-phase silica obtained from E. Merck, Darmstadt, Germany;

(iv) yields are given for illustration only and are not necessarily the maximum attainable;

(v) melting points are uncorrected and were determined using a Mettler SP62  
15 automatic melting point apparatus, an oil-bath apparatus or a Koffler hot plate apparatus.

(vi) the structures of the end-products of the formula I were confirmed by nuclear (generally proton) magnetic resonance (NMR) and mass spectral techniques; proton magnetic resonance chemical shift values were measured on the delta scale and peak multiplicities are shown as follows: s, singlet; d, doublet; t, triplet; m, multiplet; br, broad; q, quartet, quin,  
20 quintet;

(vii) intermediates were not generally fully characterised and purity was assessed by thin layer chromatography (TLC), high-performance liquid chromatography (HPLC), infra-red (IR) or NMR analysis;

(viii) HPLC were run under 2 different conditions:

- 25 1) on a TSK Gel super ODS 2µM 4.6mm x 5cm column, eluting with a gradient of methanol in water (containing 1% acetic acid) 20 to 100% in 5 minutes. Flow rate 1.4 ml/minute. Detection: U.V. at 254 nm and light scattering detections;

The viscous suspension was diluted with NMP (180ml) and stirred overnight. The solution of 7-benzyloxy-4-chloro-6-methoxyquinazoline was added and the suspension

15 stirred at 100°C for 2.5 hours. The suspension was allowed to cool to ambient temperature and poured into water (1.5l) with vigorous stirring. The starting material was prepared as follows:

5 A mixture of 4-hydroxy-3-methoxybenzoic acid (8.4g, 50mmol), 3-(pyrrolidin-1-yl)propyl chloride (14.75g, 0.1mol), (J. Am. Chem. Soc. 1955, 77, 2272), potassium carbonate (13.8g, 0.1mol) and potassium iodide (1.66g, 10mmol) in DMF (150ml) was stirred and heated at 100°C for 3 hours. The mixture was allowed to cool and the insolubles were removed by filtration and the volatiles were removed from the filtrate by evaporation. The  
10 residue was dissolved in ethanol (75ml), 2M aqueous sodium hydroxide (75ml) was added and the mixture was heated at 90°C for 2 hours. m-Chloroperoxybenzoic acid (67%, 25 g, 97.2 mmol) was added in portions to 3-(methylthio)-1-propanol (5 ml, 48.6 mmol) in solution in dichloromethane. The reaction was complete once the reaction became homogeneous. Silica was added and the volatiles were removed by evaporation. The free flowing powder was placed on the top of a flash chromatography column pre-equilibrated with ethyl acetate (100%). Elution was done using ethyl acetate (100%) followed by methylene chloride/ethyl acetate/methanol (60/35/5). 0.5M Triphenylphosphine in methylene chloride and diisopropyl azodicarboxylate (150 $\mu$ l, 0.75mmol) were added in portions to a suspension of 7-hydroxy-6-methoxy-4-(2-methylindol-5-yloxy)quinazoline (112mg, 0.35mmol), (prepared as described in Example 49), and *N,N*-dimethylethanolamine (62mg, 0.7mmol) in methylene chloride (2ml). After stirring for 2 hours at ambient temperature, the reaction mixture was poured onto an isolute® column (10g of silica) and eluted with ethyl acetate/methylene chloride (1/1) followed by methanol/ethyl acetate/methylene chloride (10/40/50), methanol/methylene chloride (10/90), and 3M ammonia in methanol/methanol/methylene chloride (5/15/80). After removal of the volatiles by evaporation, the residue was dissolved in the minimum amount of methylene chloride (about 3ml) and ether and petroleum ether (about 10ml) was added. The resulting precipitate was collected by filtration and dried under vacuum to give 7-(2-(*N,N*-dimethylamino)ethoxy)-6-methoxy-4-(2-methylindol-5-yloxy)quinazoline (52mg, 38%).

The starting material was prepared as follows:

A mixture of 7-benzyloxy-4-chloro-6-methoxyquinazoline (3g, 10 mmol), (prepared as described for the starting material in Example 1), 5-hydroxyindole (1.46g, 11 mmol) in DMF (30ml) containing potassium carbonate (2.75g, 20 mmol) was heated at 95°C for 2 hours. a) 4-(2,3-Dimethylindol-5-ylamino)-7-hydroxy-6-methoxyquinazoline (68 mg, 0.2 mmol) was reacted with 3-(5-methyl-[1,2,4]-triazol-1-yl)propan-1-ol (40 mg) to give 4-(2,3-dimethylindol-5-ylamino)-6-methoxy-7-(3-(5-methyl-1*H*-[1,2,4]-triazol-1-yl)propoxy)quinazoline.

The starting material was prepared as follows:

Under argon, 1,2,4-triazole (13.8g, 200mmol) was added to a solution of sodium ethoxide (freshly prepared from sodium (4.6g) and ethanol (250ml)). After complete dissolution, 3-bromopropan-1-ol (18ml, 200 mmol) was added dropwise. The mixture was refluxed for 18 hours and the solid was filtered and washed with ethanol. The filtrate was evaporated and the residue was purified by column chromatography eluting with methylene chloride/methanol (9/1) to give 3-(1,2,4-triazol-1-yl)propan-1-ol (22.8 g, 90%).

To a solution of 3-(1,2,4-triazol-1-yl)propan-1-ol (7 g, 55 mmol) in DMF (70ml) was added *tert*butyldimethylsilyl chloride (9.1g, 60 mmol) followed by DMAP (336mg, 2.7 mmol) followed by imidazole (4.5gr, 66 mmol). After stirring overnight at ambient temperature, the volatiles were removed under vacuum and the residue was partitioned between water and ethyl acetate/ether. The organic layer was separated, washed with water, brine, dried (MgSO<sub>4</sub>) and evaporated. The residue was purified by column chromatography eluting with methylene chloride/ether (6/4) to give 3-(*tert*butyldimethylsilyloxy)-1-(1,2,4-triazol-1-yl)propane (11.1 gr, 84%).

A mixture of 4-(4-bromo-2-fluorophenoxy)-7-hydroxy-6-methoxyquinazoline (9.64g, 26.4 mmol) and triphenylphosphine (20.9g, 79.8 mmol) in dichloromethane (240ml) was stirred under nitrogen, at ambient temperature for 30 minutes. 3-(N-tertButoxycarbonyl)-propanolamine (6.26g, 35.8 mmol) was added followed by diethyl azodicarboxylate (12.4ml, 13.7g, 78.7 mmol). The starting material was prepared as follows:

2-Chloro-4-methoxyaniline (2.719g, 14 mmol) was added to 8.0M aqueous hydrochloric acid (15 ml) and the suspension cooled to -5 °C. Sodium nitrite (1.063g, 15.4 mmol) was added as a solution in water (3 ml). After addition the pH was brought to pH 4-5 by addition of sodium acetate. In a separate flask, ethyl-α-ethyl acetoacetate (2.18 ml, 15.4 mmol) in ethanol (15 ml) at -5 °C was treated with potassium hydroxide (864 mg, 15.4 mmol) in water (3 ml) followed by ice (4 g). The diazonium salt prepared initially was then added rapidly to the second solution and stirred at -5 °C for 4 hours then allowed to warm to ambient temperature overnight. The mixture was extracted with ethyl acetate (3 x 100 ml) and the organic solutions dried (MgSO<sub>4</sub>), filtered and solvent removed *in vacuo* to give an orange oil. This oil was dissolved in ethanol (35 ml) and the flask fitted with a reflux condenser. Concentrated sulphuric acid (35 ml) was then added dropwise, this caused the reaction to reflux with no external heating. The solution was stirred for 1 hour then the solvent removed by evaporation. The residue was taken up in water then extracted with ethyl acetate (3 x 100 ml). The organic solution was washed with brine, dried (MgSO<sub>4</sub>), filtered and evaporated to give a brown oil. The crude oil was purified by silica column chromatography, eluting with

dichloromethane to give ethyl 7-chloro-5-methoxyindole-2-carboxylate (125 mg, 4%).

Water was carefully added and the pH adjusted to pH 6-7 by addition of 2M sodium hydroxide. The mixture was extracted with ethyl acetate (2 x 50

## 5 Example 189

To a portion of 2-chloro-5-hydroxybenzimidazole (191 mg, 0.75 mmol) in DMF (3 ml) was added sodium hydride (60 mg, 1.5 mmol) under argon at ambient temperature. Ten minutes later 4-chloro-6-methoxy-7-(1-methylpiperidin-4-yl)methoxyquinazoline (200 mg, 0.62 mmol), (prepared as described for the starting material in Example 10), was added and the mixture heated at 100 °C for 2 hours. More 2-chloro-5-hydroxybenzimidazole (30 mg, 0.12 mmol) and sodium hydride (11 mg, 0.28 mmol) were then added as the reaction was found to be incomplete. The heating was continued for an additional 1 hour. Work-up using ethyl acetate and a saturated aqueous solution of ammonium chloride followed by drying of the organic phase (MgSO<sub>4</sub>) and evaporation of the solvent gave a crude product which was adsorbed on alumina using dichloromethane/methanol and purified by flash chromatography using neutral alumina and dichloromethane/methanol (98:2) as the eluent.

Evaporation of the solvent and trituration in ether gave 4-(2-chloro-1*H*-benzimidazol-6-yloxy)-6-methoxy-7-((1-methylpiperidin-4-yl)methoxy)quinazoline (46 mg, 16%).

The starting material was prepared as follows:

The free base of 4-methoxy-1,2-phenylenediamine dihydrochloride (10 g) was obtained by shaking it with a mixture of ethyl acetate and a saturated aqueous solution of sodium hydrogen carbonate. The organic phase was then washed with brine, dried (MgSO<sub>4</sub>) and the solvent evaporated. The obtained dark oil (6.08 g, 50 mmol) was solubilised in toluene (60 ml) and p-toluene sulfonic acid (60 mg) and triethyl orthoacetate (9.15 ml, 50 mmol) were added in turn. The residue was dissolved in ethyl acetate and the organic layer was washed with aqueous sodium hydrogen carbonate, brine and evaporated to give 4-fluoro-5-hydroxy-2-methylindole. The residue was purified by column chromatography eluting with ethyl acetate/petroleum ether (3/7) to give 4-fluoro-5-hydroxy-2-methylindole (63 mg, 30%). Analytical data as above.

Alternatively the 4-fluoro-5-methoxy-2-methylindole can be prepared as follows:

A solution of sodium methoxide (freshly prepared from sodium (1.71g) and methanol (35ml)) was added to a solution of 1,2-difluoro-3-(2,2-dimethoxypropyl)-4-nitrobenzene (16.2 g, 62 mmol), (prepared as described above), in methanol (200ml) cooled at 5°C. The mixture was left to warm to ambient temperature and was stirred for 3 days. The volatiles were removed under vacuum and the residue was partitioned between ethyl acetate and 2N hydrochloric acid (1ml). The organic layer was concentrated to a total volume of 100ml and THF (100ml) and 6N hydrochloric acid (25ml) were added. The mixture was stirred for 1 hour at ambient temperature. The volatiles were removed under vacuum and the residue was

partitioned between ethyl acetate and water. The organic layer was separated, washed with water, brine, dried ( $\text{MgSO}_4$ ) and evaporated. The residue was purified by column chromatography eluting with ethyl acetate/petroleum ether (3/7) to give 3-acetylmethyl-2-fluoro-1-methoxy-4-nitrobenzene (12.7 g, 90%).

The starting material was prepared as follows:

A mixture of ethyl 5-methoxyindole-2-carboxylate (8.15 g, 37.2 mmol), (prepared by the method described in Heterocycles Vol. 43, No. 2, p. 263-266), nitric acid adsorbed on silica gel (24g) and dichloromethane (150 ml) was stirred at ambient temperature for 18 hours. Ethyl 5-hydroxy-4-nitroindole-2-carboxylate (1.0 g, 3.8 mmol.) was suspended in a mixture of ethanol (20 ml) and water (5 ml). Potassium hydroxide (840 mg) was added and the mixture stirred at 50 °C under an atmosphere of nitrogen for 1 hour then cooled to ambient temperature. The solvent was evaporated *in vacuo* and the residue re-dissolved in water (25 ml). The pH was adjusted to pH2 using aqueous hydrochloric acid (2M ). The resulting

The crude 5-methoxy-4-nitroindole-2-carboxylic acid (720 mg, 3.05 mmol), quinoline (9 ml) and copper chromite (180 mg) were stirred together. Nitrogen was gently bubbled through the mixture for 5 minutes, then the mixture was heated quickly to 225°C, and stirred at this temperature for 40 minutes under an atmosphere of nitrogen. ### Example 318

To a suspension of 7-hydroxy-6-methoxy-4-(2-methyl-1*H*-indol-5-yloxy)quinazoline (1.36g, 4.24mmol), (prepared as described in Example 49), in DMF (70ml), was added  
10 potassium carbonate (2.34g, 17.0mmol, 4eq.) followed by (5*R*)-5-(*p*-toluenesulphonylmethyl)-2-pyrrolidinone (1.25g, 4.66mmol, 1.1eq.), (prepared as described for the starting material in Example 317), and the resulting yellow suspension heated at reflux. After 4 hours, some starting material remained, and a further addition of (5*R*)-5-(*p*-toluenesulphonylmethyl)-2-pyrrolidinone (0.57g, 2.12mmol, 0.5eq.) was made. The reaction  
15 was heated at reflux for a further 2 hours resulting in consumption of starting material. The reaction was cooled to ambient temperature, the inorganic residue filtered off and the filtrate evaporated *in vacuo* to leave a brown oil which was purified by column chromatography (methylene chloride/methanol, (100/0 to 90/10)) to give a light brown oil. Trituration with ether afforded a thick oil, which upon chromatography eluting as above gave a yellow oil.  
20 Trituration of this oil with ether gave an initial crop of (5*R*)-6-methoxy-4-(2-methyl-1*H*-indol-5-yloxy)-7-(2-oxopyrrolidin-5-ylmethoxy)quinazoline (5mg) as an off-white solid (ca. 90% pure by nmr). Chromatography of the residues (eluting as above) followed by ether trituration gave further crops of (5*R*)-6-methoxy-4-(2-methyl-1*H*-indol-5-yloxy)-7-(2-oxopyrrolidin-5-ylmethoxy)quinazoline as a white solid (180mg, >95% pure by nmr), as an  
25 off-white solid (800mg, ca. 95% pure by nmr).

**Example 319**

To a solution of 7-hydroxy-6-methoxy-4-(2-methyl-1*H*-indol-5-yloxy)quinazoline (4.8g, 15.7mmol), (prepared as described in Example 49), in DMF (100 ml), was added potassium carbonate (6.5g, 47mmol) and 3-chloropropyl piperidine (3.3g, 20.4mmol). The reaction was then heated to 100°C for 4 hours. The inorganic material was filtered off and the DMF removed by evaporation. The residue was then purified by chromatography eluting from methylene chloride to 10 % methanol/90% methylene chloride (+1% ammonium hydroxide). The relevant fractions were concentrated and the residue dissolved in ethyl acetate. Hexane was added and the precipitate was filtered off. The filtrate was evaporated and the residue was triturated with ether and filtered to give **6-methoxy-4-(1-(3-piperidinopropyl)-1*H*-indol-5-yloxy)-7-(3-piperidinopropoxy)quinazoline** (170mg, 1.9%) as a white solid.

Sodium hydride (71 mg, 1.8 mmol) was added to 5-hydroxy-2-methylbenzimidazole (204 mg, 0.89 mmol) in anhydrous DMF (2.5 ml) under an argon atmosphere. The mixture was stirred at ambient temperature for 10 minutes. 4-Chloro-6,7-dimethoxyquinazoline (200 mg, 0.89 mmol) was added and the reaction mixture stirred at 95 °C for 2 hours. Upon cooling to ambient temperature the mixture was poured in water and extracted with ethyl acetate.
